Automatic scrubber-drier Hakomatic B 70

Feel the difference

With the Hakomatic B 70 Bad Oldesloe based Hako-Werke are introducing a new scrubber-drier for efficient wet cleaning of medium sized and large areas. Simple handling, innovative technology and high performance ensure perceptibly better working and low running costs.

You can feel the difference when working with the machine on a daily basis simply as a result of the compact, handy construction of the Hakomatic B 70. The machine is easy to manoeuvre and offers optimum visibility of the area to be cleaned. The operational elements of the Hakomatic B 70 are so clearly laid out and self-explanatory that lengthy training periods are superfluous. When cleaning, the operator has considerably more room for his feet when walking behind the machine. Infinitely variable drive propels the Hakomatic B 70, with which a maximum area performance of 3.200 m² is possible. The battery running time, which corresponds to this level of performance as well as the on-board charger, fitted as standard, make it possible to have the machine ready for use all the time.

Two powerful brush motors guarantee an even cleaning result over the complete working width. On the Hakomatic B 70 there are 65 cm plate brushes; the equipment version B 70 CL and CLH can be equipped, as an option, with a cylindrical brush head with integrated sweeping function and a working width of 60 cm. All brush heads are manufactured out of corrosion-proof, sturdy cast aluminium. The low brush deck height – of under 10 cm – makes it possible to clean underneath obstacles. As a result of the direct brush release system BRS the brushes can be changed quickly and easily.

08/2006

Environmental aspects and cost factors were at the fore when it came to the development of the Hakomatic B 70: as a result of the Hako-Aqua-Control-System considerably less water and cleaning agent are consumed: the brushes and water supply are stopped automatically when the machine comes to a standstill. The dosage of cleaning solution is precise and is dependent upon the speed of the machine (equipment version CL). Afterwards new squeegee geometry ensures that the cleaning solution is picked up safely – even if the floor conditions are difficult. Also new are the rubber squeegee lips, which are highly resistant to wear caused by rubbing. They can be used four times and can be changed quickly and easily without the need for tools, thanks to a quick attachment device.

As a result of the various model versions, the Hakomatic B 70 can be adapted to suit different application demands. For example, the CL version offers higher battery running times, the brush pressure can be increased on the plate brush unit or there is also an optional noise reduction package: this “Silencer Option“ reduces noise development considerably. This feature has also been used in the CLH version where it has been especially tailor-made to suit the requirements of hospitals. In addition this version is equipped with a mop holder, a space for cleaning utensils and a dirty water tank in white. The white tank is available for all versions and forms the basis of customer-specific design: with individually coloured side panels the Hakomatic B 70 can be adapted economically to fit in with the corresponding customer corporate design and identity.
